

ABSTRACT

1 To provide a wireless communication system and a
2 wireless communication method including: a first terminal
3 apparatus comprising a computer main body and a second
4 terminal apparatus comprising a displaying section, wherein
5 the two terminal apparatuses perform wireless communication
6 with each other without communication crossing. A
7 management center obtains the positional information of a
8 first terminal apparatus, and then records the positional
9 information. The management center determines a
10 communication channel free from communication crossing,
11 depending on the positional information. The communication
12 channel determined by the management center is transmitted
13 to the first terminal apparatus. The first terminal
14 apparatus and a second terminal apparatus perform wireless
15 communication with each other through the received
16 communication channel.
